IN REPLY REFER TO: Joint Interoperability Test Command (JTE) **5 Jan 11**

MEMORANDUM FOR DISTRIBUTION

Subject: Special Interoperability Test Certification of the Amcom Software Inc., Computer Telephony Integration (CTI) Release 4.0.6 with Alcatel-Lucent's 8520 and 8528T Integrated Services Digital Network (ISDN) Voice Terminal Hard Consoles

References: (a) DoD Directive 4630.05, "Interoperability and Supportability of Information Technology (IT) and National Security Systems (NSS)," 5 May 2004
(b) CJCSI 6212.01E, "Interoperability and Supportability of Information Technology and National Security Systems," 15 December 2008
(c) through (e), see Enclosure 1

1. References (a) and (b) establish the Defense Information Systems Agency (DISA), Joint Interoperability Test Command (JITC), as the responsible organization for interoperability test certification.

2. The Amcom Software Inc., CTI Release 4.0.6 with Alcatel-Lucent's 8520 and 8528T ISDN Voice Terminal Hard Consoles is hereinafter referred to as the System Under Test (SUT). The Amcom CTI workstation Personal Computer (PC) connects to the Alcatel-Lucent's 8520 and 8528T ISDN Voice Terminal Hard Consoles via a serial cable, which enables Amcom CTI operators to have access to the same features and functions as the Alcatel-Lucent 8520 and 8528T ISDN Voice terminal hard consoles. The SUT was tested with the Alcatel-Lucent Class 5 Electronic Switching System (5ESS). JITC analysis determined a minor risk in certifying the SUT with all versions of Alcatel-Lucent 5ESS, the Alcatel-Lucent Compact Digital Exchange (CDX), and Alcatel-Lucent Very Compact Digital Exchange (VCDX) switching systems listed on the Unified Capabilities (UC) Approved Products List (APL). The SUT meets all of the critical interoperability requirements for an Attendant Console and is certified for joint use within the Defense Information System Network (DISN) when used with any of these switching systems. The SUT met the critical interoperability requirements for attendant services set forth in Reference (c). Testing was conducted using test procedures derived from Reference (d). No other configurations, features, or functions, except those cited within this report, are certified by the JITC. This certification expires upon changes that affect interoperability, but no later than three years from the date of Defense Information Assurance (IA)/Security Accreditation Working Group (DSAWG) accreditation.

3. This certification is based on interoperability testing conducted by JITC, review of the vendor's Letters of Compliance (LoC), and DSAWG accreditation. Interoperability testing was

conducted by JITC at the Global Information Grid Network Test Facility, Fort Huachuca, Arizona, from 28 April through 9 May 2008. Review of vendor's LoC was completed on 29 April 2008. The SUT supports the same software, interfaces, and functionality as when it was previously tested. The only difference is that the SUT now supports either Microsoft XP or Microsoft Windows Vista operating system platform. A review of the SUT and comparison with the new requirements in Reference (c) was conducted on 19 March 2010 to determine the SUT was certified for interoperability within the DISN without additional interoperability testing. DSAWG granted accreditation on 5 January 2011 based on the security testing completed by DISA-led IA test teams and published in a separate report, Reference (e). The Certification Testing Summary (Enclosure 2) documents the test results and describes the test configuration.

4. The Functional Requirements used to evaluate the interoperability of the SUT and the interoperability statuses are indicated in Table 1.

Table 1. SUT Functional Requirements and Interoperability Status

Interface	Critical	Certified	Critical Functional Requirements	Met	UCR Paragraph
ISDN BRI with 5ECustom Protocol (See note 1.)	Yes	Yes	Precedence and Preemption (R)	Yes	5.2.1.2.1
			Call Display (R)	Yes	5.2.1.2.2
			Class of Service Override (R)	Yes	5.2.1.2.3
			Busy Override and Busy Verification (R)	Yes	5.2.1.2.4
			Night Service (R)	Yes	5.2.1.2.5
			Automatic Recall of Attendant (R)	Yes	5.2.1.2.6
			Calls in Queue to the Attendant (R)	Yes	5.2.1.2.7
	Yes	Yes	Security (R)	See note 2.	3.2.3, 3.2.5, and 5.4.6.1

NOTES:
1 The SUT is certified with all versions of Alcatel-Lucent 5ESS, the Alcatel-Lucent CDX, and Alcatel-Lucent VCDX switching systems listed on the UC APL.
2 Security is tested by DISA-led Information Assurance test teams and published in a separate report, Reference (e).

5. No detailed test report was developed in accordance with the Program Manager's request. JITC distributes interoperability information via the JITC Electronic Report Distribution (ERD) system, which uses Unclassified-But-Sensitive Internet Protocol Router Network (NIPRNet) e-mail. More comprehensive interoperability status information is available via the JITC System Tracking Program (STP). The STP is accessible by .mil/gov users on the NIPRNet at https://stp.fhu.disa.mil. Test reports, lessons learned, and related testing documents and references are on the JITC Joint Interoperability Tool (JIT) at http://jit.fhu.disa.mil (NIPRNet), or http://199.208.204.125 (SIPRNet). Information related to Defense Switched Network (DSN) testing is on the Telecom Switched Services Interoperability (TSSI) website at http://jitc.fhu.disa.mil/tssi. Due to the sensitivity of the information, the Information Assurance

Accreditation Package (IAAP) that contains the approved configuration and deployment guide must be requested directly through government civilian or uniformed military personnel from the Unified Capabilities Certification Office (UCCO), e-mail: ucco@disa.mil.

6. The JITC point of contact is Mr. Cary Hogan, DSN 879-2589, commercial (520) 538-2589, FAX DSN 879-4347, or e-mail to cary.hogan@disa.mil. The JITC's mailing address is P.O. Box 12798, Fort Huachuca, AZ 85670-2798. The tracking number for the SUT is 0934901.

CERTIFICATION TESTING SUMMARY

1. SYSTEM TITLE. Amcom Software Inc., Computer Telephony Integration (CTI) Release 4.0.6 with Alcatel-Lucent's 8520 and 8528T Integrated Services Digital Network (ISDN) Voice Terminal Hard Consoles; hereinafter referred to as System Under Test (SUT).

2. PROPONENT. Headquarters United States Army Information Systems Engineering Command (HQ USAISEC).

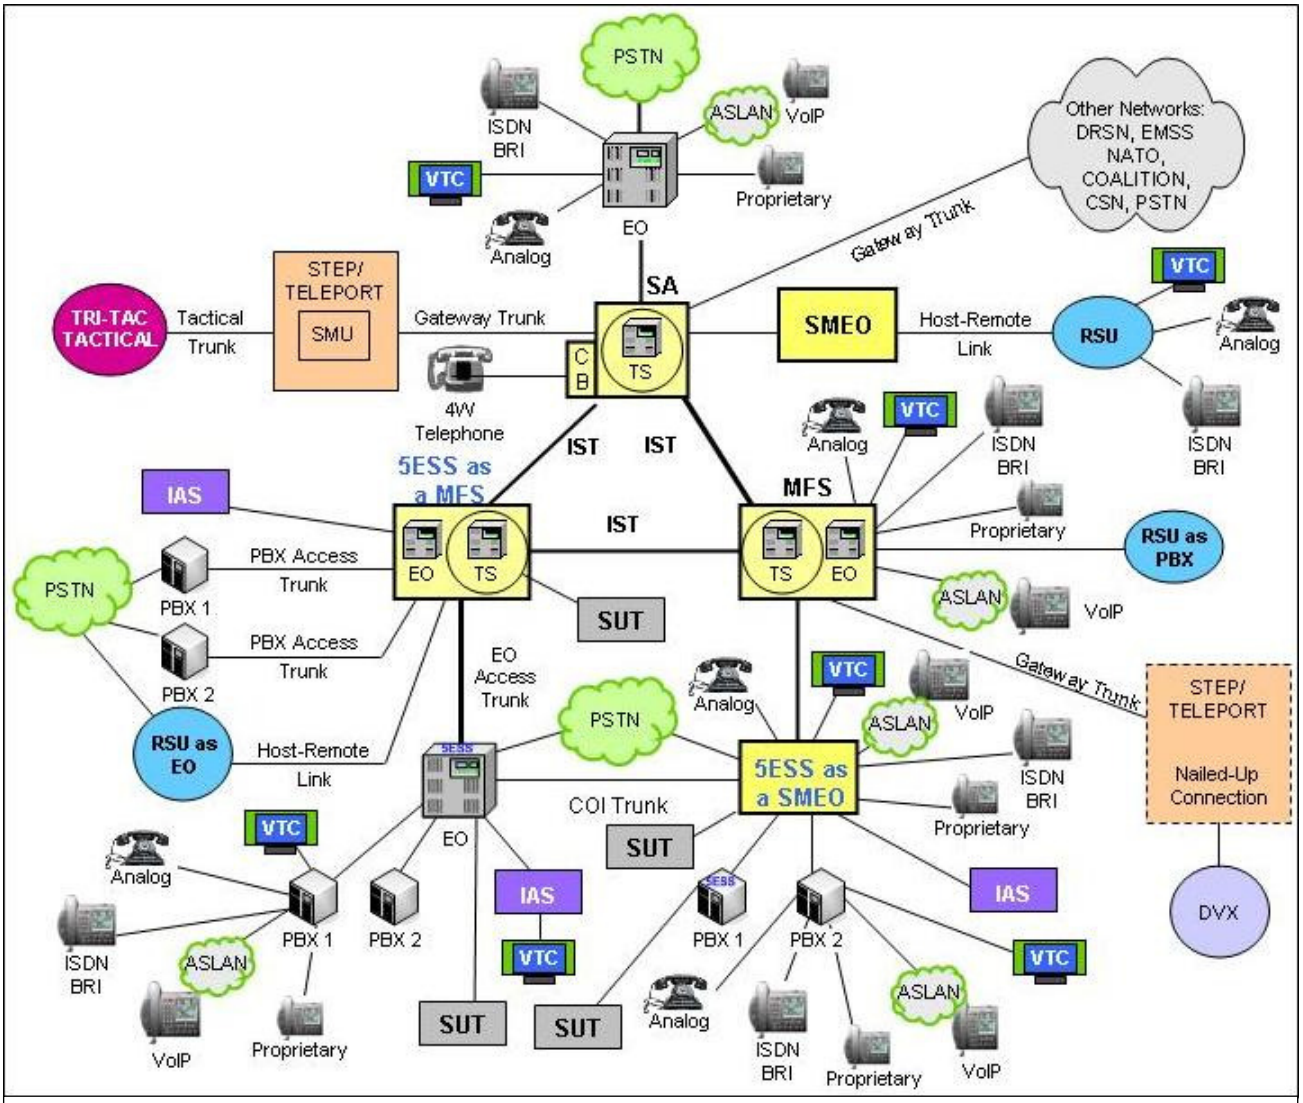
3. PROGRAM MANAGER. Mr. Steve Austin, AMSEL-IE-IS, Building 53301, Fort Huachuca, Arizona, 85613-5300, e-mail: steven.austin@us.army.mil.

4. TESTER. Joint Interoperability Test Command (JITC), Fort Huachuca, Arizona.

5. SYSTEM UNDER TEST DESCRIPTION. The SUT is an Attendant Console. The Amcom CTI workstation Personal Computer (PC) connects to the Alcatel-Lucent's 8520 and 8528T ISDN Voice Terminal Hard Consoles via a serial cable, which enables Amcom CTI operators to have access to the same features and functions as the Alcatel-Lucent 8520 and 8528T ISDN Voice terminal hard consoles. The Amcom CTI PC employs Phone Server software Version 4.0.6 running on the Windows XP Professional Operating System. The SUT features include:

- Answering, parking, holding, and transferring calls.
- Position busy, end-to-end signaling, busy verification, and display of queued calls.
- Call forwarding, do not disturb, serial calls, trouble key, and trunk access control.
- Call handling, control, and security features.
- Set of screen and web-based applications including directory services, paging, messaging, and on-call scheduling.

6. OPERATIONAL ARCHITECTURE. The Unified Capabilities Requirements (UCR) Defense Switched Network (DSN) architecture in Figure 2-1 depicts the relationship of the SUT to the DSN switches.



NOTE: The SUT is certified with all versions of Alcatel-Lucent 5ESS, the Alcatel-Lucent Compact Digital Exchange (CDX), and Alcatel-Lucent Very Compact Digital Exchange (VCDX) switching systems listed on the Unified Capabilities (UC) Approved Products List (APL).

8. TEST NETWORK DESCRIPTION. The SUT was tested at JITC's Global Information Grid Network Test Facility in a manner and configuration similar to that of the DSN operational environment. Testing the system's required functions and features was conducted using the test configuration depicted in Figure 2-2.

Figure 2-2. SUT Test Configuration

9. SYSTEM CONFIGURATIONS. Table 2-2 provides the system configurations, hardware, and software components tested with the SUT. The SUT was tested in an operationally realistic environment to determine interoperability with a complement of DSN switches noted in Table 2-2. The DSN switches listed in Table 2-2 only depict the tested configuration. Table 2-2 is not intended to identify the only switch software releases that are certified with the SUT. The SUT was tested with the Alcatel-Lucent 5ESS. The SUT is also certified with all versions of Alcatel-Lucent 5ESS, the Alcatel-Lucent Compact Digital Exchange (CDX), and Alcatel-Lucent Very Compact Digital Exchange (VCDX) switching systems listed on the Unified Capabilities (UC) Approved Products List (APL).

Table 2-2. Tested System Configurations

System Name		Hardware/Software Release
Alcatel-Lucent 5ESS Digital Switching System		5E16.2 Broadcast Warning Message (BWM) 07-0003
Siemens EWSD		Release 19d Patch Set 46
Alcatel-Lucent 311A (Hard Console)		Version A1-A-03
SUT	Alcatel-Lucent 8528T Voice Terminal (Hard Console) See note.	Software ID FP3.6 08/13/96
	Alcatel-Lucent 8520 Voice Terminal (Hard Console) See note.	Software ID FP3.2 05/02/94
	Amcom Software Phone Server (Soft Console) (SUT)	Version 4.0.6
	Oracle Client	Client 10G
	HP DL-380 Server	RH Linux Enterprise ES 4.0 Oracle Enterprise Database 10 G Rel. Version 10.2.0.3 Oracle Application Server 10 G Rel. Version 10.1.2.0.2 AMCOM Application Server 4.0.6.1
	Hewlett-Packard Compaq PC	Windows XP-Pro with Service Pack 2

NOTE: The SUT is certified with both the Alcatel-Lucent 8528T and 8520 hard consoles, and can be purchased with both or either model.

10. TEST LIMITATIONS. None.

11. TEST RESULTS

a. Discussion

(1) The UCR, paragraph 5.2.1.2.1, states the attendant console shall interoperate with Multi-Level Precedence and Preemption (MLPP) as described in UCR, section 5.2.2. The console shall be able to initiate all levels of precedence calls (i.e., ROUTINE through FLASH-OVERRIDE). The SUT successfully met the requirements for MLPP as described in section 5.2.2 of Reference (c).

(2) The UCR, paragraph 5.2.1.2.2, states the attendant console shall provide a visual display of the calling number, Class of Service (CoS), and precedence level for incoming direct dialed calls and diverted calls to the attendant. The SUT provided a visual display of the calling number, CoS, and precedence level for incoming direct-dialed calls and diverted calls to the attendant.

(3) The UCR, paragraph 5.2.1.2.3, states the attendant shall provide the capability to override any class of service (calling area or precedence) of the calling party on a call-by-call basis. The SUT provided the capability to override any CoS (calling area or precedence) of the calling party on a call-by-call basis.

(4) The UCR, paragraph 5.2.1.2.4, states the attendant shall have the capability to override a busy line condition. If the called line being verified is busy, off-hook supervision shall be given to the attendant performing the busy verification. When a verification code is used, all digits of the code must be dialed before cut-through to the line can be accomplished. Connections to commercial Central Office access lines shall be restricted from busy verification access. The attendant shall have the capability to enter an existing busy line to inform the user of an incoming call. An override tone shall be provided to the busy line prior to the attendant entering the conversation, and the tone shall be repeated periodically as long as the attendant is connected. Selected stations may be classmarked to deny attendant break-in. In particular, it shall be possible to classmark the lines of selected stations (e.g., all data and secure voice) to preclude the busy verification or busy override being applied to the selected station lines. The SUT meets the following Functional Requirements for busy override and busy verification:

(a) The SUT successfully demonstrated the capability to override a busy line condition. If the called line being verified was busy, off-hook supervision was given to the attendant performing the busy verification.

(b) The SUT successfully demonstrated the capability to enter an existing busy line to inform the user of an incoming call. An override tone was provided to the busy line prior to the attendant entering the conversation, and the tone was repeated periodically as long as the attendant was connected.

(5) The UCR, paragraph 5.2.1.2.5, states the attendant console shall have the ability to route all calls normally directed to the console to a night service deflection. The night service deflection shall be a fixed or manually selected directory number. The SUT successfully demonstrated the ability to route all calls normally directed to the console to a night service deflection. The night service deflection was a fixed or manually selected directory number.

(6) The UCR, paragraph 5.2.1.2.6, states when an attendant extends a call to a station that is busy or does not answer within a preset time, the extended party shall be recalled automatically to the console. Recalls shall be transferred to the console that originally processed the call. If that console is busy, the recall shall be placed into the

console queue; but if the console is out of service, the recall shall be routed to another console. When the SUT extends a call to a station that did not answer within a preset time, the extended party was automatically recalled only to the console that forwarded the call. In addition, if the call is extended to a station that is busy, recall is accomplished by the SUT by invoking a feature called “Camp-on”. This feature will allow the SUT to release call control to the extended caller who will receive ringback and ring the called party as soon as the called party is hangs up. Because the basic functionality of this feature is supported by the SUT and the SUT’s inability to recall to another console, other than the console that forwarded the call is considered to have a minor operational impact.

(7) The UCR, paragraph 5.2.1.2.7, states the attendant console shall have the capability to place calls in a waiting queue. Calls placed in queue to the attendant console shall be retrieved by the attendant in order of precedence level (FLASH-OVERRIDE first, ROUTINE last) and longest holding time. Calls in queue shall not be lost when a console is placed out of service or forwarded to night service deflection. When the console is placed out of service or forwarded to night service while calls are in queue, the console shall be capable of one of the following solutions:

(a) All calls in queue shall be forwarded first to the centralized attendant, then to night service.

(b) All subsequent calls placed to the attendant console shall be forwarded first to the centralized attendant and then to night service. The attendant console will be able to answer all remaining calls in queue, preventing any calls from being lost.

The SUT successfully demonstrated this requirement by forwarding all calls in queue to the night service deflection with the exception of the call offered to the SUT upon transfer. The call offered to the SUT upon transfer is answered then all subsequent calls placed to the SUT are forwarded to the night service deflection.

(8) Security is tested and met by DISA-led Information Assurance test teams and is published in a separate report, Reference (e).

b. Test Summary. The Amcom CTI workstation PC connects to the Alcatel-Lucent's 8520 and 8528T ISDN Voice Terminal Hard Consoles via a serial cable, which enables Amcom CTI operators to have access to the same features and functions as the Alcatel-Lucent 8520 and 8528T ISDN Voice terminal hard consoles. The SUT meets all of the critical interoperability requirements for an attendant console and is certified for joint use within the Defense Information System Network (DISN) specifically with the Alcatel-Lucent 5ESS, Alcatel-Lucent CDX, and Alcatel-Lucent VCDX switching systems listed on the UC APL.

12. TEST AND ANALYSIS REPORT. No detailed test report was developed in accordance with the Program Manager’s request. JITC distributes interoperability information via the JITC Electronic Report Distribution (ERD) system, which uses

Unclassified-But-Sensitive Internet Protocol Router Network (NIPRNet) e-mail. More comprehensive interoperability status information is available via the JITC System Tracking Program (STP). The STP is accessible by .mil/gov users on the NIPRNet at https://stp.fhu.disa.mil. Test reports, lessons learned, and related testing documents and references are on the JITC Joint Interoperability Tool (JIT) at http://jit.fhu.disa.mil (NIPRNet), or http://199.208.204.125 (SIPRNet). Information related to DSN testing is on the Telecom Switched Services Interoperability (TSSI) website at http://jitc.fhu.disa.mil/tssi. Due to the sensitivity of the information, the Information Assurance Accreditation Package (IAAP) that contains the approved configuration and deployment guide must be requested directly through government civilian or uniformed military personnel from the Unified Capabilities Certification Office (UCCO), e-mail: ucco@disa.mil.
